1 OVERVIEW

<u>HES9510 Hybrid Energy Controller</u> is used for diesel gensets with solar energy, wind energy, energy storage battery in inverter as output energy systems, which can control the start and stop of inverter power supply, output mode, output size as well output closing/opening of breaker, etc. It can also control the start and stop of gensets in system according to the loads, provide spinning reverse for the inverter power supply. In addition, it can also control the inverter for energy storage battery charging and discharging management to realize the data measurement, alarm protection as well as "three-remote" functions. It fits with large LCD display, optional Chinese, English and other languages interface, and it is reliable and easy to use.

<u>HES9510 Hybrid Energy Controller</u> applies 32-bit microprocessor technology, realizing the functions of precise measurement, fixed value adjustment, timing and setting value of various parameters. Most parameters can be adjusted from the front panel of the controller, and all parameters can be adjusted by PC via USB or RS485, Ethernet interface. Its compact structure, simple connection and high reliability can be widely used in hybrid energy control system.

2 PERFORMANCE AND CHARACTERISTICS

Main characteristics are as bellow:

- With ARM-based 32-bit SCM, high integration of hardware and more reliable;
- 240x128 LCD with backlight, multilingual interface (including English, Chinese or other languages)
 which can be chosen on site, making commissioning convenient for factory personnel;
- Improved LCD wear-resistance and scratch resistance due to hard screen acrylic;
- Silicon panel and pushbuttons for better operation in high/low temperature environment;

Two RS485 communication ports enable remote control, remote measuring, remote communication via MODBUS protocol;

- A variety of built-in protocols enable communication with inverters such as HUAWEI;

Suitable for 3-phase 4-wire, 3-phase 3-wire, single phase 2-wire, and 2-phase 3-wire systems with voltage 120/240V and frequency 50/60Hz;

 Collects and displays 3-phase voltage, frequency, 3-phase current, power and voltage harmonic parameters;

— For Busbar, controller has loss of phase and reverse phase sequence detection functions; For new energy, controller has over voltage, under voltage, over frequency, under frequency, high unbalanced voltage, high total harmonic distortion, over current, earth fault, high unbalanced current, low power factor, over power, reverse power, loss of excitation, loss of phase, reverse phase sequence detection functions;

 5 analog sensor inputs can be set to temperature, pressure, level, power inverters or irradiance sensors;

Partial sensor inputs can connect with resistor type, voltage type or current type sensors;

Voltage, current and power display of up to 4-way solar panel channels can be set;

- The maximum capacity of PV calculated by collecting up to 3-way solar panel temperature and 3-way solar irradiance;
- Various of temperature, pressure and oil level sensor curves can be used directly or customized;
- Busbar normal automatic closing and starting with load, automatic soft loading and soft unloading;
- Two active power control modes (fixed power, inverter control);
- Three reactive power control modes (fixed power, power factor, inverter control);
- Each energy can be set or calculated as rated active power, rated reactive power and rated apparent power. The rated active power of PV power station can be calculated in real time according to the sensor data and weather data, the rated power of gensets can be calculated in real time according to the information of online units, the rated power of energy storage power station and mains supply can be set for direct use;
- The controller is able to control the priority of energy use (mains supply, gensets, PV power station (including wind power station), energy storage power station). Each energy can be prioritized

SmartGen ideas for power

separately, and the smaller the priority value, the higher the priority. Default: PV power station >energy storage station >mains supply>gensets. It supports dynamic prioritization;

 The input port can be set to make them unavailable for mains supply, PV power station, gensets and energy storage power station. When the energy is unavailable, the energy will no longer provide energy and spinning reserve.

 Parameter setting function: parameters can be modified by users and stored in internal EEPROM memory, and cannot be lost even in case of power outage; most of them can be adjusted from the front panel of the controller and all of them can be modified on PC by USB ports and RS485 ports;

- Wide power supply range DC(8~35)V, suitable for different starting battery voltage environment;

Event log, real-time clock;

- Black box function, which allows to record the genset data of 5 alarms;

 All parameters apply digital adjustment, getting rid of conventional analogue modulation with normal potentiometer, and improving genset reliability and stability;

 IP65 waterproof level is achieved with the help of rubber-ring gasket between shell and control panel;

 Metal fixing clips employed to fix the controller and make it perform better under high temperature environment;

Modular structure design, self-extinguishing ABS plastic shell, pluggable terminal, built-in mounting, compact structure with easy installation;

3 SPECIFICATION

Table 3 Technical Specification

Parameter	Details
Working Voltage	Range: DC8V ~ DC35V continuous, DC reverse connection
	protection
	Resolution: 0.1V
	Accuracy: 1%
Overall Consumption	<7W (Standby mode: ≤2.5W)
	Phase voltage
	Range: AC15V ~ AC360V (ph-N)
	Resolution: 0.1V
AC Voltage	Accuracy: 0.5%
AC Voltage	Wire voltage
	Range: AC30V - AC620V (ph- ph)
	Resolution: 0.1V
	Accuracy: 0.5%
AC Frequency	Range: 5Hz -75Hz
	Resolution: 0.01Hz
	Accuracy: 0.1Hz
AC Current	Rated: 5A
	Range: 0A – 10A
	Resolution: 0.1A
	Accuracy: 1%
Analog Sensor	Resistor Input
	Range: 0Ω- 6000Ω
	Resolution: 0.1
	Accuracy: 1Ω (below 300 Ω)
	Voltage Input
	Range: 0 V~5V
	Resolution: 0.001V
	Accuracy: 1%
	Current Input
	Range: 0 mA ~20mA
	Resolution: 0.01mA
	Accuracy: 1%
Digital Output 1	16A DC24V DC power supply output (relay output)
Digital Output 2	16A DC24V DC power supply output (relay output)
Digital Output 3	5A DC30V DC power supply output (relay output)
Digital Output 4	5A DC30V DC power supply output (relay output)
Digital Output 5	5A DC30V DC power supply output (relay output)
Digital Output 6	8A DC250V volt-free output (relay output)

Parameter	Details
Digital Output 7	8A DC250V volt-free output (relay output)
Digital Output 8	8A DC250V volt-free output (relay output)
Digital Output 9	1A DC30V DC power supply output (transistor output)
Digital Output 10	1A DC30V DC power supply output (transistor output)
Digital Input 1-10	Low limit voltage is 1.2V; high limit input voltage is 60V;
RS485	Isolated, half-duplex, 9600 baud rate, maximum communication
	length 1000m
Ethernet	Self-adapting 10/100Mbit
MSC CAN	Isolated, maximum communication length 250m; for further
	distances, CAN bus relay module SGCAN300 is recommended.
EMC/CE Certification	EN 61326-1:2013
Vibration Test	5 - 8 Hz: ±7.5 mm
	8 - 500 Hz: 2 g
	IEC 60068-2-6
Shock Test	50g, 11ms, half-sine, complete shock test from three directions, and
	18 times shock for each test
	IEC 60068-2-27
Bump Test	25g, 16ms, self-sine
	IEC 60255-21-2
Production Compliance	According to EN 61010-1 installation category (over voltage category)
	III, 300V, pollution class 2, altitude 3000m
Case Dimensions	242 mm x 186 mm x 49 mm
Panel Cutout	214mm x 160mm
Working Conditions	Temperature: (-25~+70)°C Relative Humidity: (20~93)%RH
Storage Conditions	Temperature:(-30~+80)°C
	Front Enclosure: IP65 when rubber-ring gasket is installed between
Protection Level	the enclosure and the control panel
	Rear Enclosure: IP20
	Apply AC2.2kV voltage between high voltage terminal and low
Insulation Intensity	voltage terminal and the leakage current is not more than 3mA within
	1min.
Weight	1.1kg

4 OPERATION

4.1 INDICATOR LAMP

NOTE: Description for parts of indicators:

Table 4 Alarm indicator Description

··· –	
Alarm Type	Alarm Indicator
Warning	Slow flashing (1 time per second)
Block	Slow flashing (1 time per second)
Safety Trip	Fast flashing (5 times per second)
Safety Trip and Stop	Fast flashing (5 times per second)
Trip	Fast flashing (5 times per second)
Trip and Stop	Fast flashing (5 times per second)
Shutdown	Fast flashing (5 times per second)
No Alarm	Extinguished

Running indicator: is normally illuminated after crank disconnection and before ETS stop and extinguished for other periods.

New energy normal indicator: is normally illuminated when the new energy is normal; flashing when new energy state is abnormal; extinguished when there is no new energy.

Busbar normal indicator: is normally illuminated when the busbar is normal; flashing when busbar is abnormal; extinguished when there is no busbar.

4.2 PUSHBUTTONS

Table 5 Button Function Description

lcons	Buttons	Description
		Stop the running inverter in Auto/Manual mode;
O	Stop	Reset alarm in stop mode;
		Lamp test (press at least 3 seconds);
	Start	Start the inverter in Manual mode.
200	Manual Mode	Press this button and the controller goes in Manual mode.
((2)	Auto Mode	Press this button and controller goes in Auto mode.
	Mute/Reset Alarm	Remove the alarm sound;
	Wute/Reset Alaini	Remove the alarm by pressing for over 3s.
		In manual mode, the mode conversion of various power
Mada	Mada	stations, PQ mode (constant power) and VF mode (constant
Mode	Mode	frequency and constant voltage), can be controlled to charge
		and discharge conversion of energy storage power stations.
		In manual mode to control the new energy breaker closing.
		In manual mode, PV power station and energy storage power
	Close	station have separate circuit breakers, and the corresponding
		circuit breaker closing can be controlled at the state interface of
		PV power station or energy storage switch.
		In manual mode to control the new energy breaker opening.
		In manual mode, PV power station and energy storage power
	Open	station have separate circuit breakers, and the corresponding
		circuit breaker opening can be controlled at the state interface
		of PV power station or energy storage switch.
		1) Screen scroll;
	Up/Increase	2) Move up the cursor and increase value in setting menu.
\sim	D. (D.	1) Screen scroll;
	Down/Decrease	2) Move down the cursor and decrease value in setting menu.
\land		1) Daga acroll:
(◀[Left	1) Page scroll;
\sim		2) Left move the cursor in setting menu.
\bigcirc		1) Page scroll;
	Right	2) Right move the cursor in setting menu.
		1) Enter setting screen;
(ф/ок)	Set/Confirm	2) Enter in next menu or confirm configuration in setting menu.
\sim		

Icons	Buttons Description		
- HS	Evit	1) Return to main menu;	
	Exit	2) Return to previous menu in setting menu.	

ACAUTION: Factory default password is "00318", and users can change it in case others change the advanced parameter settings. Please clearly remember the password after changing. If you forget it, please contact SmartGen services and send the PD information in the controller page of "**ABOUT**" to the service personnel.

4.3 LCD DISPLAY

4.3.1 MAIN DISPLAY

Paging is applied for the main screen; is used for page scroll and for screen scroll.

Main Screen includes the following contents:

PV: voltage, frequency, current, active power, reactive power;

Busbar: voltage, frequency, active power, reactive power;

New energy: voltage, frequency, current;

Converter(enabled): active power, reactive power;

Battery voltage;

Part of status displays;

Status page includes the following contents:

Busbar status, priority of new energy, controller mode, PV working status, breaker status, PV breaker status, storage energy status.

Sensor page includes the following contents:

Digital analog1-5 data, power voltage.

PV page includes the following contents:

PV input DC voltage, PV input DC current, PV input DC power, output active power, output reactive power, total energy, total generating time, PV current active power percentage, PV target active power percentage, PV current reactive power percentage, PV current reactive power percentage, PV breaker status, total starting up time, times.

Storage energy power station parameters includes the following contents;

Output voltage, frequency, current, battery pack voltage and current.

New energy page includes the following contents:

Phase voltage, line voltage, frequency, phase, current, each phase active power, total active power and percentage, each phase reactive power, total reactive power and percentage, each phase apparent power, total apparent power, each phase power factor, average power factor, total energy, earth current and percentage, unbalanced current and percentage, unbalanced soltage percentage.

NOTE:

Fig. 2 Power Factor Display Description

Table 6 Power Factor Display Description

Power Factor	Conditions	Active Power	Reactive Power	Remark
COS>0L	P>0,Q>0	Input	Input	Load is resistive induction.
COS>0C	P>0,Q<0	Input	Output	Load is resistive capacitance.
COS<0L	P<0,Q>0	Output	Input	Load equals an under excitation generator.
COS<0C	P<0,Q<0	Output	Output	Load equals an over excitation generator.

NOTES:

- 1. Input active power, and new energy will send active power to load.
- 2. Output active power, and load will supply electricity to new energy.
- 3. Input reactive power, and new energy will send reactive power to load.
- 4. Output reactive power, and load will send reactive power to new energy.

Busbar page includes the following contents:

Phase voltage, line voltage, frequency, phase sequence; available power.

Alarm page

Event log page:

Make records about all start/stop events (alarm events except warnings, manual start/stop events) and the real time when events occur;

Extension Page

AIN8 analog input module sensor 1-8.

Module and other information include the following contents:

Module time and Date, input/output port status, communication indication and Ethernet configuration (if configured), extended input port status, extended output port status.

About page includes the following contents:

Release software version, hardware version, and product PD number.

4.3.2 USER MENU AND PARAMETER SETTING

Press button for more than 1s and it enters user menu.

Parameter Setting

After inputting the correct password (factory default password is 00318) you can enter the parameter setting screen.

• Language

Optional Simplified Chinese, English and others.

4.4 AUTO START/STOP OPERATION

Press the velocity button and the indicator beside is illuminated, which means the genset is at Auto Start

Mode.

Automatic Start of PV Power Station:

Application mode: when mains supply is available, the system priority is: PV>Storage Energy>Mains Supply>Gen

When mains supply is normal, and the mains supply module sends out start order or remote start input is active, the PV power station will start and output power to the load, and VF (constant frequency and constant voltage) is provided by the mains power.

When mains supply is abnormal, and the mains supply module sends out start order or remote start input is active, if the energy storage power station is allowed to start, the energy storage power station will start in VF mode (constant frequency and constant voltage), the PV power station will start and output power to the load.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

Remote start input is active, if busbar is normal, PV power station will start and output power to the load; otherwise if storage energy is allowed to start, the energy storage power station will start in VF mode (constant frequency and constant voltage), the PV power station will start and output power to the load.

Remote start input is active, if busbar is normal, PV power station will start and output power to the load; otherwise if storage energy is not allowed to start, the gensets will start in VF mode (constant frequency and constant voltage), the PV power station will start and output load to the load.

Automatic Stop of PV Power Station:

Application mode: when mains supply is available, the system priority is: PV>Storage Energy>Mains Supply>Gen

When mains supply is normal, and the mains supply module sends out stop order or remote start input is inactive, the PV power station will stop with soft unloading.

When mains supply is abnormal, and the mains supply module sends out stop order or remote start input is inactive, if storage energy is not allowed to discharge, PV power station will stop with soft unloading.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

When energy storage station is not allowed to discharge and gensets are not allowed to start, PV power station will stop with soft unloading.

When remote start input is inactive, PV power station will stop with soft unloading.

Automatic Start of Storage Energy Power Station:

Application mode: when mains supply is available, the system priority is: PV>Storage Energy>Mains Supply>Gen

When mains supply is normal, PV power station will output power to the load, when the target power of new energy from mains supply module is greater than the power of PV power station, and the energy storage power station is allowed to discharge, the storage energy breaker will close and output, the energy storage station starts and outputs power to the load.

When mains supply is abnormal, the energy storage power station will start in VF mode (constant frequency and constant voltage), the PV power station starts and outputs power to the load.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

If remote start input is active, energy storage power station will start.

When gensets haven't been started, the energy storage power station will start in VF mode (constant frequency and constant voltage), and the energy storage switch closes and outputs

When genset have been started, the energy storage power station will start in PQ mode (constant power), and the genset operates in VF mode (constant frequency and constant voltage).

Automatic Stop of Storage Energy Power Station:

Application mode: when mains supply is available, the system priority is: PV>Storage Energy>Mains Supply>Gen

Mains supply is normal, when the target power of new energy from mains supply module is lower than the power of PV power station, the PV power station will charge for energy storage power station, and the unit will stop when energy storage power station is fully charged.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

When energy storage station is not allowed to discharge, gensets will start and energy storage power station will stop with soft unloading.

When remote start input is inactive, energy storage power station will stop.

Automatic Start of Gensets:

Application mode: when mains supply is available, the system priority is: PV>Storage Energy>Mains Supply>Gen

The mains supply module controls the start of gensets.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

Remote start input is active, when energy storage power station is not allowed to discharge, the gensets will start in VF mode (constant frequency and constant voltage).

Automatic Stop of Gensets:

Application mode: when mains supply is island, the system priority is: PV>Storage Energy>Mains Supply>Gen

The mains supply module controls the stop of gensets.

Application mode: island mode, the system priority is: PV>Storage Energy >Gen

Energy storage power station is allowed to discharge and meets the load requirements, the gensets will stop.

Remote start input is inactive, the gensets will stop.

4.5 AUTO START/STOP FLOW CHART

Application Mode: mains supply is available.

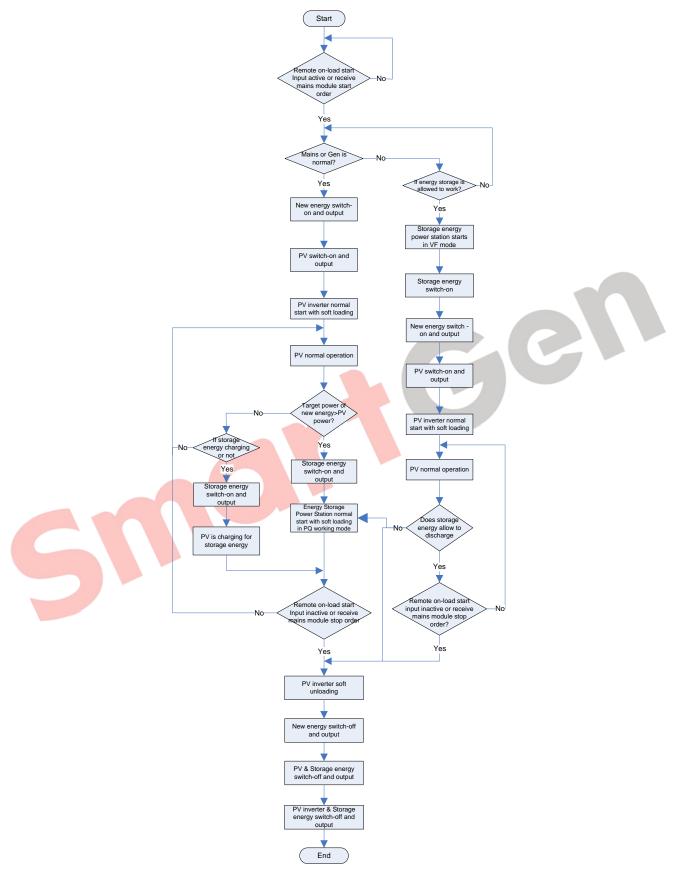

Fig.3 Mains Auto Start/Stop Flow Chart

Application Mode: Island Mode (mains supply is unavailable).

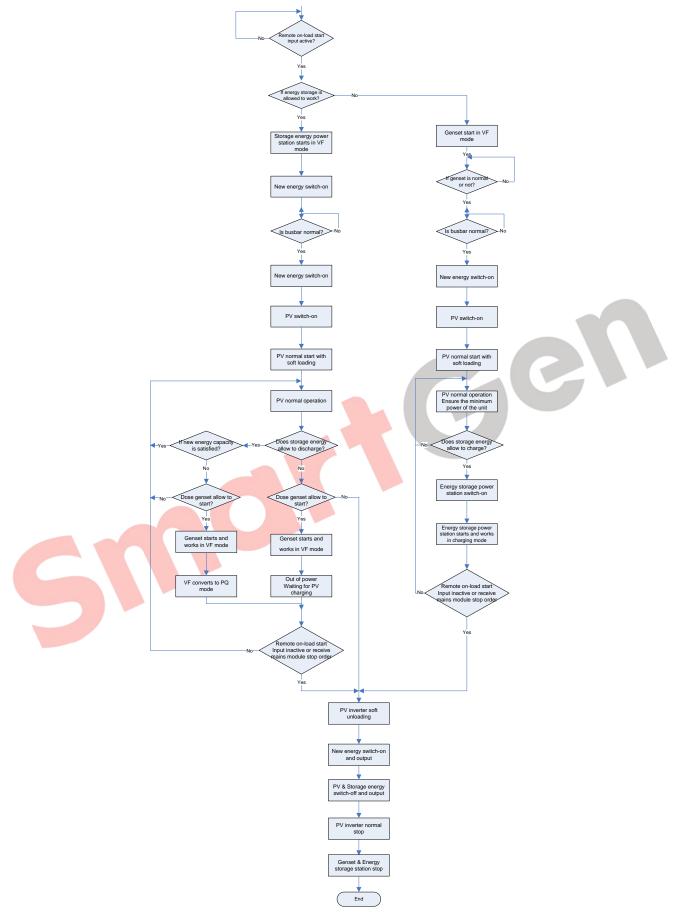

Fig.4 Island Mode Auto Start/Stop Flow Chart

4.6 MANUAL START/STOP OPERATION

1. MANUAL START: press 2 button to enter "Manual Mode" and the indicator light is illuminated. In

this mode, firstly press button to close the new energy, press button to start inverter, it can detect crank disconnect condition automatically and the inverter enters normal running. In the status-storage energy interface, press the start button and then the storage energy will start normally, the PQ mode and VF mode switches by Mode button.

2. MANUAL STOP: Press ond it can shut down the running inverters. The storage energy

power station and gensets in running can also be shut down.

ANOTE: In "manual mode", please refer to the manual for the Switch Control Procedure.

4.7 SWITCH CONTROL PROCEDURES

4.7.1 MANUAL TRANSFER PROCEDURES

When controller is in **Manual** mode, the switch control procedures will start through manual transfer procedures. Users can control it to switch on or off via pressing the button.

New Energy Close Operation: When the voltage of busbar is normal, press 🚞 button to switch on.

PV1-4 Breaker Close Operation: When the new energy closes, the controller interface will switch to the

corresponding PV breaker status page, and press button, the corresponding PV breaker will close and the relay will output.

New Energy Open Operation: Press the Gen open button and it will issue a closing signal of new energy.

PV1-4 Breaker Open Operation: When controller interface switches to the corresponding PV breaker

status page, press *button*, the corresponding PV breaker will open and the relay will output.

4.7.2 AUTOMATIC CONTROL PROCEDURE

When controller is in Auto mode, the switch control procedure is automatic control procedure.

ANOTE: The auxiliary close input should be configured necessarily and make sure the connection is correct.

5.2 WARNING ALARMS

When controller detects the warning alarm, it only issues warning, and the genset does not open and shutdown. When the warning signal disappears, it is removed automatically.

Table 8 Warning Alarms

No	Туре	Description
1	New Energy Over Frequency	When this is enabled, and the controller detects the frequency is above the preset limit, it shall issue a warning. It is always detected.
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue a warning.It is detected when inverter in normal running and 'stop after cooling' shutdown.
3	New Energy Over Voltage	When this is enabled, and the controller detects the voltage is above the preset limit, it shall issue a warning. It is always detected.
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue a warning.It is detected when inverter in normal running and 'stop after cooling' shutdown.
5	New Energy Over Current	When this is enabled, and the controller detects the current is above the preset limit, it shall issue a warning. It is always detected.
6	Negative Sequence Current	When this is enabled, and the controller detects the value is above the preset limit, it shall issue a warning. It is always detected.
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue a warning. It is always detected.
8	New Energy Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue a warning. It is always detected.
9	New Energy Over Power	When this is enabled, and the controller detects the new energy power (positive) is above the preset limit, it shall issue a warning. It is always detected.
10	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue a warning. It is always detected.
11	Flex. Sensor 1-5 High	When over high warning is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue a warning. It is always detected.
12	Flex. Sensor 1-5 Low	When over low warning is enabled, and the controller detects the sensor value is below the preset low limit, it shall issue a warning.

No	Туре	Description
		It is always detected when the sensor is selected as fuel level sensor.
13	Flex. Sensor 1-5 Wrong	When voltage or current input is selected for the curve type of the controller, and the controller detects input signal is abnormal, it shall issue a warning, and meanwhile the curve is transferred to resistor type to prevent damaging the controller. It is detected always.
14	Fail to Stop	When controller detects 'fail to stop', it shall issue a warning.
15	Power Supply Over Volt	When this is enabled, and the controller detects the power supply voltage is above the preset limit, it shall issue a warning signal. It is always detected.
16	Power Supply Under Volt	When this is enabled, and the controller detects the Power Supply voltage is below the preset limit, it shall issue a warning signal. It is always detected.
17	New Energy Breaker Alarm	When the controller input port does not set the new energy closing state input, it shall issue a warning signal. It is always detected.
18	Inverter 1 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 1, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.
19	Inverter 1 Alarm	When the controller and the inverter communicate normally, the controller shall issue a warning signal when the inverter alarm is received.
20	Inverter 2 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 2, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.
21	Inverter 2 Alarm	When the controller and the inverter communicate normally, the controller shall issue a warning signal when the inverter alarm is received.
22	Inverter 3 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 3, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.
23	Inverter 3 Alarm	When the controller and the inverter communicate normally, the controller shall issue a warning signal when the inverter alarm is received.
24	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.
25	Inverter 4 Alarm	When the controller and the inverter communicate normally, the controller shall issue a warning signal when the inverter alarm is

No	Туре	Description
		received.
26		When the digital input port is set users-defined and if it is active, the
	Digital Input Alarm	controller will initiate a warning for the input port.
		It is detected in the detection range set for the input port.
		When PLC function is set users-defined and if it is active, the controller
27	PLC Functions Alarm	will initiate a warning.
		It is detected in the detection range set by the PLC function.
		When DIN16 communication is enabled and the controller cannot
28	DIN16 Com. Fail	receive the communication data, it will initiate a warning.
		It is always detected.
		When DIN16 input is set users-defined and if it is active, the controller
29	DIN16 Input Alarm	will initiate a warning.
		It is detected in the detection range set in the input.
		When DOUT16 communication is enabled and the controller cannot
30	DOUT16 Com. Fail	receive the communication data, it will initiate a warning.
		It is always detected.
		When AIN8 communication is enabled and the controller cannot
31	AIN8 Com. Fail	receive the communication data, it will initiate a warning.
		It is always detected.
		When the controller detects the sensor circuit is open, it shall issue a
32	AIN8 Sensor Open	warning.
		It is always detected.
		When over high warning is enabled, and the controller detects the
33	AIN8 Sensor High	sensor value is above the preset upper limit, it shall issue a warning.
		It is always detected.
		When over low warning is enabled, and the controller detects the
34	AIN8 Sensor Low	sensor value is below the preset lower limit, it shall issue a warning.
		It is always detected.
		When this is enabled and the controller detects that the generator
35	Power Factor Low	power factor has fallen below the pre-set value, it will initiate a warning
35		alarm.
		It is always detected.
36		When this is enabled and the controller detects that the THD has
	THD High	exceeded the pre-set value, it will initiate a warning alarm.
		It is always detected.
		When this is enabled and the controller detects that the voltage
37	New Energy Volt	unbalanced value has exceeded the pre-set value, it will initiate a
	Unbalance	warning alarm.
		It is always detected.
	Unpalance	-

5.3 BLOCK ALARMS

When the controller detects block signals, it only issues warning and the genset does not shutdown and not open. Users need to reset alarms manually.

Table 9 Block Alarms

No	Туре	Description
1	New Energy Over Frequency	When this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue a block alarm. It is detected always.
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue a block alarm. It is detected when inverter in normal running and 'stop after cooling' shutdown.
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue a block alarm. It is detected always.
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue a block alarm. It is detected when inverter in normal running and 'stop after cooling' shutdown.
5	New Energy Over Current	When this is enabled, and the controller detects the new energy current is above preset limit, it shall issue a block alarm. It is detected always.
6	Negative Sequence Current	When this is enabled, and the controller detects the unbalanced current is above preset limit, it shall issue a block alarm. It is detected always.
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue a block alarm. It is always detected.
8	Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue a block alarm. It is always detected.
9	Over Power	When this is enabled, and the controller detects the new energy power (positive) is above the preset limit, it shall issue a block alarm. It is always detected.
10	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue a block alarm. It is always detected.
11	Flex. Sensor 1-5 High	When over high block alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue a block alarm. It is always detected.
12	Flex. Sensor 1-5 Low	When over low block alarm is enabled, and the controller detects the

No	Туре	Description
		sensor value is below the preset low limit, it shall issue a block alarm.
		It is always detected.
13	Flex. Sensor 1-5 Wrong	When voltage or current input is selected for the curve type of the controller, and the controller detects input signal is abnormal, it shall issue a block alarm, and meanwhile the curve is transferred to resistor type to prevent damaging the controller. It is detected always.
14	Fail to Stop	When controller detects 'fail to stop', it shall issue a warning.
15	Power Supply Over Volt	When this is enabled, and the controller detects the power supply voltage is above the preset limit, it shall issue a block signal. It is always detected.
16	Power Supply Under Volt	When this is enabled, and the controller detects the power supply voltage is below the preset limit, it shall issue a block signal. It is always detected.
17	Digital Input Alarm	When the closing status input is not set in the put port, the controller will initiate a block signal for the input port. It is always detected.
18	Inverter 1 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 1, it shall issue a block signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
19	Inverter 2 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 2, it shall issue a block signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
20	Inverter 3 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 3, it shall issue a block signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
21	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue a block signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
22	Digital Input Alarm	When the digital input port is set users-defined and if it is active, the controller will initiate a block signal for the input port. It is detected in the detection range set for the input port.
23	PLC Functions Alarm	When PLC function is set users-defined and if it is active, the controller will initiate a block signal.It is detected in the detection range set by the PLC function.

No	Туре	Description
24	DIN16 Com. Fail	When DIN16 communication is enabled and the controller cannot receive the communication data, it will initiate a block signal. It is always detected.
25	DIN16 Input Alarm	When DIN16 input is set users-defined and if it is active, the controller will initiate a block signal. It is detected in the detection range set in the input.
26	DOUT16 Com. Fail	When DOUT16 communication is enabled and the controller cannot receive the communication data, it will initiate a block signal. It is always detected.
27	AIN8 Com. Fail	When AIN8 communication is enabled and the controller cannot receive the communication data, it will initiate a block signal. It is always detected.
28	AIN8 Sensor Open	When the controller detects the sensor circuit is open, it shall issue a block alarm. It is always detected.
29	AIN8 Sensor High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue a block alarm. It is always detected.
30	AIN8 Sensor Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset lower limit, it shall issue a block alarm. It is always detected.
31	Power Factor Low	When this is enabled and the controller detects that the new energy power factor has fallen below the pre-set limit, it will initiate a block alarm. It is always detected.
32	THD High	When this is enabled and the controller detects that the THD has exceeded the pre-set limit, it will initiate a block alarm. It is always detected.
33	New Energy Volt Unbalance	When this is enabled and the controller detects that the voltage unbalanced value has exceeded the pre-set limit, it will initiate a block alarm. It is always detected.

5.4 SAFETY TRIP

When controller detects safety trip signals, it will open breaker after soft unloading but not stop the genset. Users need to reset alarms manually.

Table 10 Safety Trip

No	Туре	Description
1	New Energy Over Frequency	When this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue an alarm signal. It is always detected.
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue an alarm signal. It is always detected.
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
5	New Energy Over Current	When this is enabled, and the controller detects the new energy current is above preset limit, it shall issue an alarm signal. It is always detected.
6	Negative Sequence Current	When this is enabled, and the controller detects the unbalanced current is above preset limit, it shall issue an alarm signal. It is always detected.
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue an alarm signal. It is always detected.
8	Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue an alarm signal. It is always detected.
9	Over Power	When this is enabled, and the controller detects the new energy power (positive) is above the preset limit, it shall issue an alarm signal. It is always detected.
10	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.
11	Flex. Sensor 1-5 High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected when the sensor is selected as fuel level sensor.
12	Flex. Sensor 1-5 Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset low limit, it shall issue an alarm signal.

No	Туре	Description
		It is always detected when the sensor is selected as fuel level sensor.
13	Flex. Sensor 1-5 Wrong	When voltage or current input is selected for the curve type of the controller, and the controller detects input signal is abnormal, it shall issue an alarm signal, and meanwhile the curve is transferred to resistor type to prevent damaging the controller. It is detected always.
14	Inverter 1 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 1, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is detected always.
15	Inverter 2 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 2, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is detected always.
16	Inverter 3 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 3, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is detected always.
17	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is detected always.
18	Digital Input Alarm	When the digital input port is set users-defined and if it is active, the controller will initiate an alarm signal for the input port. It is detected in the detection range set for the input port.
19	PLC Functions Alarm	When PLC function is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set by the PLC function.
20	DIN16 Com. Fail	When DIN16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal I. It is always detected.
21	DIN16 Input Alarm	When DIN16 input is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set in the input.
22	DOUT16 Com. Fail	When DOUT16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
23	AIN8 Com. Fail	When AIN8 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal.

No	Туре	Description
		It is always detected.
		When the controller detects the sensor circuit is open, it shall issue an
24	AIN8 Sensor Open	alarm signal.
		It is always detected.
		When over high alarm is enabled, and the controller detects the sensor
25	AIN8 Sensor High	value is above the preset upper limit, it shall issue an alarm signal.
		It is always detected.
		When over low alarm is enabled, and the controller detects the sensor
26	AIN8 Sensor Low	value is below the preset lower limit, it shall issue an alarm signal.
		It is always detected.
		When this is enabled and the controller detects that the new energy
27	Power Factor Low	power factor has fallen below the pre-set limit, it will initiate an alarm
21		signal.
		It is always detected.
		When this is enabled and the controller detects that the THD has
28	THD High	exceeded the pre-set limit, it will initiate an alarm signal.
		It is always detected.
		When this is enabled and the controller detects that the voltage
29	New Energy Volt	unbalanced value has exceeded the pre-set limit, it will initiate an alarm
23	Unbalance	signal.
		It is always detected.

5.5 SAFETY TRIP AND STOP ALARMS

When controller detects safety stop signals, it will open breaker after soft unloading and genset stops after cooling. Users need to reset alarms manually.

No	Туре	Description	
1	New Energy Over FrequencyWhen this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue an alarm signal. It is always detected.		
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue an alarm signal.It is detected when inverter in normal running and 'stop after cooling' shutdown.	
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue an alarm signal. It is detected always.	
4	New Energy Under Voltage	 When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown. 	
5	New Energy Over	When this is enabled, and the controller detects the new energy	

Table 11 Safety Trip and Stop Alarms

No	Туре	Description
	Current	current is above preset limit, it shall issue an alarm signal.
		It is detected always.
		When this is enabled, and the controller detects the unbalanced
6	Negative Sequence	current is above preset limit, it shall issue an alarm signal.
	Current	It is detected always.
		When this is enabled, and the controller detects the earth current is
7	Earth Fault	above the preset limit, it shall issue an alarm signal.
		It is always detected.
		When this is enabled, and the controller detects the reverse power
8	Reverse Power	(negative) is above the preset limit, it shall issue an alarm signal.
		It is always detected.
		When this is enabled, and the controller detects the genset power
9	Over Power	(positive) is above the preset limit, it shall issue an alarm signal.
		It is always detected.
		When the controller detects the sensor circuit is open, it shall issue an
10	Flex. Sensor 1-5	alarm signal.
	Open	It is always detected.
		When over high alarm is enabled, and the controller detects the sensor
11	Flex. Sensor 1-5 High	value is above the preset upper limit, it shall issue an alarm signal.
	l lon concer i c'ingn	It is always detected.
		When over low alarm is enabled, and the controller detects the sensor
12	Flex. Sensor 1-5 Low	value is below the preset low limit, it shall issue an alarm signal.
		It is always detected.
		When voltage or current input is selected for the curve type of the
		controller, and the controller detects input signal is abnormal, it shall
13	Flex. Sensor 1-5	issue an alarm signal, and meanwhile the curve is transferred to
	Wrong	resistor type to prevent damaging the controller.
		It is detected always.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 1, it shall issue an alarm signal
14	Inverter 1 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is always detected.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 2, it shall issue an alarm signal
15	Inverter 2 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is always detected.
		When the inverter communication port is enabled and the number of
16		inverters is greater than or equal to 3, it shall issue an alarm signal
	Inverter 3 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is always detected.
		n lo unitayo dotootou.

No	Туре	Description
17	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
18	Digital Input Alarm	When the digital input port is set users-defined and if it is active, the controller will initiate an alarm signal for the input port. It is detected in the detection range set for the input port.
19	PLC Functions Alarm	When PLC function is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set by the PLC function.
20	DIN16 Com. Fail	When DIN16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
21	DIN16 Input Alarm	When DIN16 input is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set in the input.
22	DOUT16 Com. Fail	When DOUT16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
23	AIN8 Com. Fail	When AIN8 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
24	AIN8 Sensor Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.
25	AIN8 Sensor High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected.
26	AIN8 Sensor Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset lower limit, it shall issue an alarm signal. It is always detected.
27	Power Factor Low	When this is enabled and the controller detects that the new energy power factor has fallen below the pre-set limit, it will initiate an alarm signal. It is always detected.
28	THD High	When this is enabled and the controller detects that the THD has exceeded the pre-set limit, it will initiate an alarm signal. It is always detected.
29	New Energy Volt Unbalance	When this is enabled and the controller detects that the voltage unbalanced value has exceeded the pre-set limit, it will initiate an alarm signal. It is always detected.

5.6 TRIP ALARMS

When controller detects trip alarms, it will open breaker directly but not stop the genset. Users need to reset alarms manually.

Table 12 T	rip Alarms
------------	------------

No	Туре	Description
1	New Energy Over Frequency	When this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue an alarm signal. It is detected always.
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue an alarm signal. It is detected always.
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
5	New Energy Over Current	When this is enabled, and the controller detects the new energy current is above preset limit, it shall issue an alarm signal. It is detected always.
6	Negative Sequence Current	When this is enabled, and the controller detects the unbalanced current is above preset limit, it shall issue an alarm signal. It is detected always.
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue an alarm signal. It is always detected.
8	Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue an alarm signal. It is always detected.
9	Over Power	When this is enabled, and the controller detects the genset power (positive) is above the preset limit, it shall issue an alarm signal. It is always detected.
10	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.
11	Flex. Sensor 1-5 High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected.
12	Flex. Sensor 1-5 Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset low limit, it shall issue an alarm signal.

No	Туре	Description
		It is always detected.
13	Flex. Sensor 1-5 Wrong	When voltage or current input is selected for the curve type of the controller, and the controller detects input signal is abnormal, it shall issue an alarm signal, and meanwhile the curve is transferred to resistor type to prevent damaging the controller. It is always detected.
14	Inverter 1 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 1, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
15	Inverter 2 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 2, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
16	Inverter 3 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 3, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
17	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.
18	Digital Input Alarm	When the digital input port is set users-defined and if it is active, the controller will initiate an alarm signal for the input port. It is detected in the detection range set for the input port.
19	PLC Functions Alarm	When PLC function is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set by the PLC function.
20	DIN16 Com. Fail	When DIN16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
21	DIN16 Input Alarm	When DIN16 input is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set in the input.
22	DOUT16 Com. Fail	When DOUT16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.
23	AIN8 Com. Fail	When AIN8 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal.

5

HES9510 HYBRID ENERGY CONTROLLER USER MANUAL

No	Туре	Description
		It is always detected.
24	AIN8 Sensor Open	When the controller detects the sensor circuit is open, it shall issue an
		alarm signal.
		It is always detected.
25	AIN8 Sensor High	When over high alarm is enabled, and the controller detects the sensor
		value is above the preset upper limit, it shall issue an alarm signal.
		It is always detected.
26	AIN8 Sensor Low	When over low alarm is enabled, and the controller detects the sensor
		value is below the preset lower limit, it shall issue an alarm signal.
		It is always detected.
27	Power Factor Low	When this is enabled and the controller detects that the new energy
		power factor has fallen below the pre-set limit, it will initiate an alarm
		signal.
		It is always detected.
28	THD High	When this is enabled and the controller detects that the THD has
		exceeded the pre-set limit, it will initiate an alarm signal.
		It is always detected.
29		When this is enabled and the controller detects that the voltage
	New Energy Volt	unbalanced value has exceeded the pre-set limit, it will initiate an alarm
	Unbalance	signal.
		It is always detected.

5.7 TRIP AND STOP ALARM

When the controller detects trip and stop signals, it will open breaker directly and stop the genset after cooling. Users need to reset alarms manually.

No	Туре	Description
1	New Energy Over Frequency	When this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue an alarm signal. It is always detected.
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue an alarm signal. It is detected always.
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.
5	New Energy Over Current	When this is enabled, and the controller detects the new energy current is above preset limit, it shall issue an alarm signal. It is always detected.
6	Negative Sequence Current	When this is enabled, and the controller detects the unbalanced current is above preset limit, it shall issue an alarm signal. It is always detected.
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue an alarm signal. It is always detected.
8	Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue an alarm signal. It is always detected.
9	Over Power	When this is enabled, and the controller detects the genset power (positive) is above the preset limit, it shall issue an alarm signal. It is always detected.
10	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.
11	Flex. Sensor 1-5 High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected.
12	Flex. Sensor 1-5 Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset low limit, it shall issue an alarm signal.

Table 13 Trip and Stop Alarms

No	Туре	Description
		It is detected after 'safety on time' before 'ETS solenoid hold' when the
		sensor is selected as temperature sensor and pressure sensor;
		It is always detected.
		When voltage or current input is selected for the curve type of the
	Flex. Sensor 1-5	controller, and the controller detects input signal is abnormal, it shall
13	Wrong	issue an alarm signal, and meanwhile the curve is transferred to
	wiong	resistor type to prevent damaging the controller.
		It is detected always.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 1, it shall issue an alarm signal
14	Inverter 1 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is detected always.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 2, it shall issue an alarm signal
15	Inverter 2 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is detected always.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 3, it shall issue an alarm signal
16	Inverter 3 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is detected always.
		When the inverter communication port is enabled and the number of
		inverters is greater than or equal to 4, it shall issue an alarm signal
17	Inverter 4 Com. Fail	when the inverter communication data cannot be detected and
		received by the controller.
		It is detected always.
		When the digital input port is set users-defined and if it is active, the
18	Digital Input Alarm	controller will initiate an alarm signal for the input port.
		It is detected in the detection range set for the input port.
		When PLC function is set users-defined and if it is active, the controller
19	PLC Functions Alarm	will initiate an alarm signal.
		It is detected in the detection range set by the PLC function.
		When DIN16 communication is enabled and the controller cannot
20	DIN16 Com. Fail	receive the communication data, it will initiate an alarm signal.
		It is always detected.
		When DIN16 input is set users-defined and if it is active, the controller
21	DIN16 Input Alarm	will initiate an alarm signal.
		It is detected in the detection range set in the input.
		When DOUT16 communication is enabled and the controller cannot
22	DOUT16 Com. Fail	receive the communication data, it will initiate an alarm signal.
		It is always detected.

5

28	THD High	exceeded the pre-set limit, it will initiate an alarm signal.				
		It is always detected.				
		When this is enabled and the controller detects that the voltage				
29	New Energy Volt	unbalanced value has exceeded the pre-set limit, it will initiate an alarm				
	Unbalance	signal.				
		It is always detected.				

5.8 SHUTDOWN ALARMS

When controller detects shutdown alarms, it will send signal to open breaker and shut down the generator. Users need to reset alarms manually.

Table 14 Shutdown Alarms

No	Туре	Description		
1	New Energy Over Frequency	When this is enabled, and the controller detects the new energy frequency is above preset limit, it shall issue an alarm signal. It is always detected.		
2	New Energy Under Frequency	When this is enabled, and the controller detects the frequency is below the preset limit, it shall issue an alarm signal.It is detected when inverter in normal running and 'stop after cooling' shutdown.		
3	New Energy Over Voltage	When this is enabled, and the controller detects the new energy voltage is above preset limit, it shall issue an alarm signal. It is always detected.		
4	New Energy Under Voltage	When this is enabled, and the controller detects the voltage is below the preset limit, it shall issue an alarm signal. It is detected when inverter in normal running and 'stop after cooling' shutdown.		
5	New Energy Over Current	When this is enabled, and the controller detects the new energy current is above preset limit, it shall issue an alarm signal. It is always detected.		
6	Negative Sequence Current	When this is enabled, and the controller detects the unbalanced current is above preset limit, it shall issue an alarm signal. It is always detected.		
7	Earth Fault	When this is enabled, and the controller detects the earth current is above the preset limit, it shall issue an alarm signal. It is always detected.		
8	Reverse Power	When this is enabled, and the controller detects the reverse power (negative) is above the preset limit, it shall issue an alarm signal. It is always detected.		
9	Over Power	When this is enabled, and the controller detects the genset power (positive) is above the preset limit, it shall issue an alarm signal. It is always detected.		
10	Power Supply Over Volt	When this is enabled, and the controller detects the power supply voltage is above the preset limit, it shall issue a warning signal. It is always detected.		
11	Power Supply Under Volt	When this is enabled, and the controller detects the Power Supply voltage is below the preset limit, it shall issue a warning signal. It is always detected.		
12	Fail to Start	When controller detects 'fail to start', it shall issue a warning. It is always detected.		

No	Туре	Description		
13	Flex. Sensor 1-5 Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.		
14	Flex. Sensor 1-5 High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected.		
15	Flex. Sensor 1-5 Low	When over low alarm is enabled, and the controller detects the sensor value is below the preset low limit, it shall issue an alarm signal. It is always detected.		
16	Flex. Sensor 1-5 Wrong	When voltage or current input is selected for the curve type of the controller, and the controller detects input signal is abnormal, it shall issue an alarm signal, and meanwhile the curve is transferred to resistor type to prevent damaging the controller. It is always detected.		
17	Inverter 1 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 1, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller. It is always detected.		
18	Inverter 1 Alarm	When the controller and the inverter communicate normally, the controller shall issue a shutdown signal when the inverter alarm is received. It is always detected.		
19	Inverter 2 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 2, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.		
20	Inverter 2 Alarm	It is always detected. When the controller and the inverter communicate normally, the controller shall issue a shutdown signal when the inverter alarm is received.		
21	Inverter 3 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 3, it shall issue an alarm sign, when the inverter communication data cannot be detected an received by the controller. It is always detected.		
22	Inverter 3 Alarm	When the controller and the inverter communicate normally, the controller shall issue a shutdown signal when the inverter alarm is received.		
23	Inverter 4 Com. Fail	When the inverter communication port is enabled and the number of inverters is greater than or equal to 4, it shall issue an alarm signal when the inverter communication data cannot be detected and received by the controller.		

No	Туре	Description			
		It is always detected.			
24	Inverter 4 Alarm	When the controller and the inverter communicate normally, the controller shall issue a shutdown signal when the inverter alarm is received.			
25	MSD ID Wrong	When the controller detects the same ID on the MSC bus, the controller will initiate a shutdown alarm signal. It is always detected. It is always detected.			
26	Digital Input Alarm	When the digital input port is set users-defined and if it is active, the controller will initiate an alarm signal for the input port. It is detected in the detection range set for the input port.			
27	PLC Functions Alarm	When PLC function is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set by the PLC function.			
28	DIN16 Com. Fail	When DIN16 communication is enabled and the controller cannot receive the communication data, it will initiate an alarm signal. It is always detected.			
29	DIN16 Input Alarm	When DIN16 input is set users-defined and if it is active, the controller will initiate an alarm signal. It is detected in the detection range set in the input.			
30	DOUT16 Com. FailWhen DOUT16 communication is enabled and the controller cDOUT16 Com. Failreceive the communication data, it will initiate an alarm signal.It is always detected.				
31	AIN8 Com. Fail When AIN8 communication is enabled and the contro receive the communication data, it will initiate an alarm sign It is always detected.				
32	AIN8 Sensor Open	When the controller detects the sensor circuit is open, it shall issue an alarm signal. It is always detected.			
33	AIN8 Sensor High	When over high alarm is enabled, and the controller detects the sensor value is above the preset upper limit, it shall issue an alarm signal. It is always detected.			
34	When over low alarm is enabled, and the controller detect				
35	 When this is enabled and the controller detects that the new power factor has fallen below the pre-set limit, it will initiate a signal. It is always detected. 				
36	THD High	When this is enabled and the controller detects that the THD has exceeded the pre-set limit, it will initiate an alarm signal. It is always detected.			
37	New Energy Volt	When this is enabled and the controller detects that the voltage			

No	Туре	Description
	Unbalance	unbalanced value has exceeded the pre-set limit, it will initiate an alarm
		signal.
		It is always detected.

6 WIRING CONNECTION

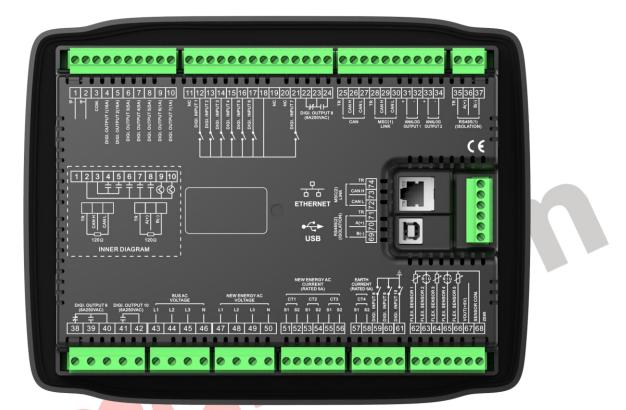

Fig. 5 HES9510 Controller Rear Panel

Table 15 Terminal Connection Description

No.	Functions	Cable Size	Remark
1	B-	1.5mm ²	Connect with battery negative.
			Connect with battery positive. If wire length is over 30m,
2	B+	1.5mm ²	it's better to double wires in parallel. Max. 20A fuse is
			recommended.
3	Output Com	1.5mm ²	AUX.1 COM and AUX.2 COM
4	Digi. output 1	1.5mm ²	B+ is supplied by 3 points, rated 16A.
5	Digi. output 2	1.5mm ²	B+ is supplied by 3 points, rated 16A.
6	Digi. output 3	1.0mm ²	B+ is supplied by 2 points, rated 5A.
7	Digi. output 4	1.0mm ²	B+ is supplied by 2 points, rated 5A.
8	Digi. output 5	1.0mm ²	B+ is supplied by 2 points, rated 5A.
9	Digi. output 6	1.0mm ²	B+ is supplied by 2 points, rated 1A.
10	Digi. output 7	1.0mm ²	B+ is supplied by 2 points, rated 1A.
11	NC	/	Reserved
12	Digi. input 1	1.0mm ²	Ground connected is active (B-).

No.	Functions	Cable Size	Remark		
13	Digi. input 2	1.0mm ²	Ground connected is active (B-).		
14	Digi. input 3	1.0mm ²	Ground connected is active (B-).		
15	Digi. input 4	1.0mm ²	Ground connected is active (B-).

19	NC	1			
20	NC	/	Reserved		
21	Digi. input 7	1.0mm ²	Ground connected is active (B-).		
22			Normally close output, rated 8A.		
23	AUX. Output 8	1.5mm ²	Public points of relay.		
24			Normally open output, rated 8A.		
25	TR	/	Impedance-120 Ω shielding wire is recommended, and		
26	CAN H	0.5mm ²	the single-end shall be earth connected. Short connect		
27	CAN L	0.5mm ²	TR with H and then connect to 120Ω terminal resistor.		
28	MSC(1) TR	/	Impedance-120 Ω shielding wire is recommended, and		
29	MSC(1) CAN H	0.5mm ²	the single-end shall be earth connected. Short connect		
30	MSC(1) CAN L	0.5mm ²	TR with H and then connect to 120Ω terminal resistor.		
31	Analog Output 1(+)	0.5mm ²			
32	Analog Output 1(-)	0.5mm ²	(-10~10)V output.		
33	Analog Output 2(+)	0.5mm ²			
34	Analog Output 2(-)	0.5mm ²	(-10~10)V output.		
35	RS485(1) TR		Impedance-120 Ω shielding wire is recommended, and		
36	RS485(1) A(+)	0.5mm ²	the single-end shall be earth connected. Short connect		
37	RS485(1) B(-)	0.5mm ²	TR with A and then connect to 120Ω terminal resistor.		
38		1.5mm ²	Normally close output, rated 8A.		
39	Digi. output 9	1.5mm ²	Normally open output, rated 8A.		
40		1.5mm ²	Public points of relay.		
41	Digi. output 10	1.5mm ²	Normally open output, rated 8A.		
42		1.5mm ²	Public points of relay.		
43	Bus A-phase voltage input	1.0mm ²	Connect to A-phase of bus (2A fuse is recommended).		
44	Bus B-phase voltage input	1.0mm ²	Connect to B-phase of bus (2A fuse is recommended).		
45	Bus C-phase voltage input	1.0mm ²	Connect to C-phase of bus (2A fuse is recommended).		
46	Bus N-wire input	1.0mm ²	Connect to N-wire of bus.		
47	New Energy A-phase voltage input	1.0mm ²	Connect to A-phase of new energy (2A fuse is recommended).		
48	New Energy B-phase voltage input	1.0mm ²	Connect to B-phase of new energy (2A fuse is recommended).		

No.	Functions	Cable Size	Remark
49	New Energy C-phase voltage input	1.0mm ²	Connect to C-phase of new energy (2A fuse is recommended).
50	New Energy N-wire input	1.0mm ²	Connect to N-wire of new energy.
51	CT A shace issue	1.5mm ²	Outside connect to secondary coil of current
52	CT A-phase input	1.5mm ²	transformer (rated 5A).
53	CT P phage input	1.5mm ²	Outside connect to secondary coil of current
54	CT B-phase input	1.5mm ²	transformer (rated 5A).
55	CT C phase input	1.5mm ²	Outside connect to secondary coil of current
56	CT C-phase input	1.5mm ²	transformer (rated 5A).
57	Forth CT input	1.5mm ²	Outside connect to secondary coil of current
58	Earth CT input	1.5mm ²	transformer (rated 5A).
59	Digi. input 8	1.0mm ²	Ground connected is active (B-).
60	Digi. input 9	1.0mm ²	Ground connected is active (B-).
61	Digi. input 10	1.0mm ²	Ground connected is active (B-).
62	Flex. sensor 1	1.0mm ²	Connect to temp. /pressure/fuel level/power transmitter/optical radiation sensor.
63	Flex. sensor 2	1.0mm ²	Connect to temp. /pressure/fuel level/power transmitter/optical radiation sensor. Voltage type (0V-5V), current type (4-20mA) and resistance sensor can be chosen.
64	Flex. sensor 3	1.0mm ²	Connect to temp. /pressure/fuel level/power transmitter/optical radiation sensor.
65	Flex. sensor 4	1.0mm ²	Connect to temp. /pressure/fuel level/power transmitter/optical radiation sensor. Voltage type (0V-5V), current type (4-20mA) and resistance sensor can be chosen.
66	Flex. sensor 5	1.0mm ²	Connect to temp. /pressure/fuel level/power transmitter/optical radiation sensor.
67	VOUT(+5V)	1.0mm ²	Provide +5V voltage for voltage type sensor, and current is below 50mA.
68	Sensor COM.	/	Public sensor terminal, and B- is already connected in the controller.
69	RS485(2) B(-)	0.5mm ²	Impedance-120 Ω shielding wire is recommended, and
70	RS485(2) A(+)	0.5mm ²	the single-end shall be earth connected. Short connect
71	RS485(2) TR	/	TR with H and then connect to 120Ω terminal resistor.
72	MSC(2) CAN L	/	Impedance-120 Ω shielding wire is recommended, and
73	MSC(2) CAN H	0.5mm ²	the single-end shall be earth connected. Short connect
74	MSC(2) TR	0.5mm ²	TR with H and then connect to 120Ω terminal resistor.
	L · · ·		

NOTE: USB ports on the controller rear panel are configurable parameter ports, and users can directly program the controller on PC.

ANOTE: ETHERNET port on the controller rear panel is parameter programming and monitoring port, and it can be programmed and monitored on PC.

7 SCOPES AND DEFINITIONS OF PROGRAMMABLE PARAMETERS

7.1 CONTENTS AND SCOPES OF PARAMETERS

Table 16 Parameter Configuration

No.	Items	Parameters	Defaults	Description
Modu	ule Setting			
1.	Power On Mode	(0-2)	0	0: Stop Mode 1: Manual Mode 2: Auto Mode
2.	Module Address	(1-254)	1	Controller address for remote monitoring
3.	Language	(0-2)	0	0: Simplified Chinese 1: English 2: Other
4.	Password	(0-65535)	00318	It is used to enter advanced parameter setting.
5.	Daylight Saving Time	(0-1)	0	0: Disable 1: Enable Start and end time for this can be set.
6.	Date and Time			It is used for date and time settings.
7.	Temperature Unit	(0-1)	0	0: °C; 1: °F
8.	Pressure Unit	(0-2)	0	0: kPa 1: Psi 2: Bar
9.	Backlight Time	(0-3600)s	300	
10.	Network	(0-1)	1	0: Disable 1: Enable
11.	Alarm Data Interval	(0-60.0)s	0.1	The interval of black box data record.
12.	RS485(1) Baud Rate	(0-2)	1	0: 4800bit/s; 1: 9600bit/s; 2: 19200bit/s
13.	RS485(1) Stop Bit	(0-1)	0	0:2bit; 1:1bit.
14.	RS485(2) Baud Rate	(0-2)	0	0:4800bit/s; 1:9600bit/s; 2:19200bit/s.
15.	RS485(2) Stop Bit	(0-1)	0	0:2bit; 1:1bit.
16.	Rated Volt	(0-60.0)V	24.0	Provide standard for judging over voltage and under voltage of power supply.
17.	Over Volt Alarm 1	(0-1)	1	0: Disable 1: Enable

No.	Items	Parameters	Defaults	Description
		(0-200.0)%	120.0	The setting value is the percentage of
		(0-200.0)%	115.0	rated voltage.
		(0-3600)s	60	The return value is the percentage of rated
		(0-7)	1	voltage.
				Delay value.
				Action.
				0: Disable 1: Enable
		(0-1)	0	The setting value is the percentage of
		(0-200.0)%	120.0	rated voltage.
18.	Over Volt Alarm 2	(0-200.0)%	115.0	The return value is the percentage of rated
		(0-3600)s	60	voltage.
		(0-7)	0	Delay value.
		(0.1)	•	Action.
				0: Disable 1: Enable
		(0-1)	1	The setting value is the percentage of
		(0-200.0)%	85.0	rated voltage.
19.	Under Volt Alarm 1	(0-200.0)%	90.0	The return value is the percentage of rated
10.		(0-3600)s	60	voltage.
		(0-7)	0	Delay value.
		(0-7)	U	Action.
				0: Disable 1: Enable
		(0-1)	0	The setting value is the percentage of
		(0-200.0)%	85.0	rated voltage.
20.	Under Volt Alarm 2	(0-200.0)%	90.0	The return value is the percentage of rated
20.		(0-3600)s	60	voltage.
		(0-7)	0	Delay value.
		(01)	0	Action.
Bush	bar Setting			
Dust	Power Supply			0: 3P4W; 1: 3P3W;
1.	System	(0-3)	0	2: 2P3W; 3: 1P2W
	Oystem			The confirm time from abnormal to normal
2.	Normal Delay	(0-3600)s	10	of the busbar.
				The confirm time from normal to abnormal
3.	Abnormal Delay	(0-3600)s	5	of the busbar.
				Provide standard for judging over voltage
				and under voltage of the busbar. If the
				voltage transformer is used, this value is
4.	Rated Volt	(30-30000)V	230	the primary voltage of the transformer.
				When the AC power supply system is
				3P3W, this setting value is line voltage;
				when it is other power supply systems, this
				setting value is phase voltage.
5.	Volt Transformer	(0-1)	0	0: Disable 1: Enable

No.	Items	Parameters	Defaults	Description
		(0-1)	1	
		(0-200.0)%	120.0	
6.	Over Volt Setting	(0-200.0)%	116.0	
		(0-3600)s	5	The setting value is the percentage of
		(0-1)	1	busbar rated voltage.
		(0-200.0)%	80.0	a desta de la consiger
7.	Under Volt Setting	(0-200.0)%	84.0	
		(0-3600)s	5	
				Provide standard for judging over
8.	Rated Freq.	(10.0-75.0)Hz	50	frequency and under frequency of busbar.
		(0-1)	0

7.2.1 DEFINED COMBINATION OUTPUT

Defined combination output is composed by 3 parts, or condition output S1, or condition output S2 and condition output S3.

S1 or S2 is **TRUE**, while S3 is **TRUE**, defined combination output is outputting;

S1 and S2 are FALSE, or S3 is FALSE, defined combination output is not outputting.

ANOTE: S1, S2, S3 can be set as any contents except for "defined combination output" in the output setting.

ANOTE: 3 parts of defined combination output (S1, S2, S3) couldn't include or recursively include themselves. For example:

Contents of or condition output S1: output port 1 is active;

Close when or condition output S1 is active /inactive: close when active (disconnect when inactive);

Contents of or condition output S2, output port 2 is active;

Close when or condition output S2 is active /inactive: close when active (disconnect when inactive);

Contents of or condition output S3: output port 3 is active;

Close when or condition output S3 is active /inactive: close when active (disconnect when inactive);

When input port 1 active or input port 2 active, if input port 3 is active, defined combination output is outputting; If input port 3 inactive, defined combination output is not outputting;

When input port 1 inactive and input port 2 inactive, whatever input port 3 is active or not, defined combination output is not outputting.

7.3 DEFINED CONTENTS OF PROGRAMMABLE INPUT PORTS

NOTE: User should make special declare when order controller if your flexible sensor 1, 3 and 5 use non-resistance

sensor.

8 PARAMETERS SETTING

CAUTION: Please change the controller parameters when generator is in standby mode only (e. g. configurable input, configurable output, various delay etc.), otherwise, alarming to stop and other abnormal conditions may happen.

ANOTE: Maximum set value must over minimum set value in case that the condition of too high as well as too low will happen.

ANOTE: When the warning alarm is set, please set the correct return value; otherwise, maybe there is abnormal alarm. When the maximum value is set, the return value must be less than the set value; when the minimum value is set, the return value must be less than the set value; when the minimum value is set, the return value must be over the set value.

ANOTE: Digital input could not be set as the same items; otherwise, there are abnormal functions. However, the digital output can be set as the same items.

9 SENSOR SETTING

1) When sensors are reselected, the sensor curves will be transferred into the standard value. For example, if temperature sensor is SGX (120°C resistor type), its sensor curve is SGD (120°C resistor type); if select the SGH (120°C resistor type), the temperature sensor curve is SGH curve.

2) When there is difference between standard sensor curves and used sensor curves, users can adjust it in the "sensor curve type".

3) When the sensor curve is inputted, x value (resistor) must be inputted from small to large, otherwise, mistake occurs.

4) If sensor type is selected as "none", sensor curve is not working.

5) If the corresponding sensor has alarm switch only, users must set this sensor as "none", otherwise, shutdown or warning may occur.

6) The headmost or backmost values in the vertical coordinates can be set as the same as below.

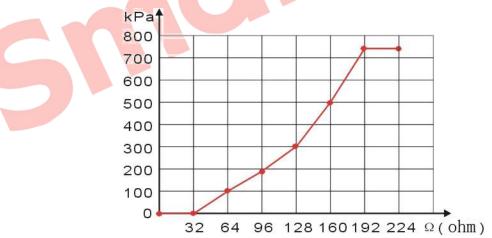

Fig. 6 Sensor Curve Diagram

Table 20 Normal Pressure Unit Conversion Form

	ра	kgf/cm ²	bar	psi
1Pa	1	1.02x10 ⁻⁵	1x10 ⁻⁵	1.45x10 ⁻⁴
1kgf/cm ²	9.8x10 ⁴	1	0.98	14.2
1bar	1x10⁵	1.02	1	14.5
1psi	6.89x10 ³	7.03x10 ⁻²	6.89x10 ⁻²	1

10 COMMISSIONING

- 1) Check the parameter configurations of the controller;
- 2) Check the if all wiring connections are correct and the wire diameter is suitable. MSC CAN wiring connection between the controllers.
- 3) Press "Close" button when busbar is normal, connect busbar to the inverter, then press the "Start" button, the inverter is going to start up. After the setting "Wait for start delay" is over, the PV inverter enters into normal running successfully. If not successfully, the controller will issue a signal of start failure.
- Select auto mode on front panel, and then switch on the busbar signal. After the normal delay of the busbar, the controller closes the circuit breaker (if has) to the inverter, and the controller starts automatically with load;
- 5) After the busbar is abnormal again, the controller will issue shutdown instruction, and then issue open new energy generation instruction. If not, refer to this manual to check the wiring of the switch control section
- 6) If there is any question, please contact our service personnel in time.

11 LOAD CONTROL MODE

11.1APPLICATION MODE

Mains Available (Large Power Grid)

The power is adjusted by HGM9560, and according to the energy priority to output constant active power and reactive power to the mains supply.

VF is provided by bus and PQ is provided by other energy.

Island Mode (Microgrid)

Mains is unavailable, and according to the setting energy priority (exclude the mains supply) to take load.

The genset provides VF prior to energy storage power station.

PV power station can't take load separately.

11.2ACTIVE POWER CONTROL MODE

Fixed Power Mode

The active power set by constant output.

Inverter Control Mode

The controller doesn't control the power output, but the inverter controls the active power output.

11.3REACTIVE POWER CONTROL MODE

Fixed Power Mode

The reactive power set by constant output.

Power Factor Control Mode

The reactive power outputs according to the power factor, or the controller automatically controls the inverter according to the power factor (if the inverter supports).

Inverter Control Mode

The controller doesn't control the power output, but the inverter controls the reactive power output.

12 APPLICATION SCENARIOS

1. The mains is available but expensive from 08:00 to 12:00. If the PV is insufficient, it is recommended to use the energy storage power station during this time period. If the energy storage power station is insufficient, use the mains and power generation according to the priority. Charging for storage energy is allowed for the mains during 00:00~06:00 and the PV is allowed to charge all the time. It is not allowed to send power back to the mains, and ensure the minimum load of the unit when using power generation.

Application Mode:Mains availableActive Power Control Mode:Fixed Power ModeMains Module:Available, the mains can provide unlimited spinning reserve, themains power is determined by setting value, the genset is controlled by the mains module.Setting Priority:08:00~12:00PV>Storage Energy>Gen>Mains SupplyOther time periodPV>Mains Supply>Storage Energy>GenSetting mains supply running charging time:00:00~06:00Set mains module to peak clipping mode, mains with load 10%.

Time period: 08:00~12:00

When the mains supply is normal and PV is closed, the PV output is controlled according to the new energy target power (Tp) sent by the mains module.

When PV power is insufficient (Tp>PV max. power), the energy storage power station starts (PQ), and the output power of the PV and energy storage power station are controlled is Tp.

When PV power is sufficient (Tp<PV max. power), if the storage energy needs to be charged, the storage energy charging is controlled so that the output power of the PV and the energy storage power station is Tp; otherwise the energy storage power station exits.

Other Time Periods:

When the mains supply is normal and PV is closed, the PV output is controlled according to the new energy target power (Tp) sent by the mains module. The storage energy can't be used.

When PV power is insufficient (Tp>PV max. power), the controller will issue an alarm of insufficient PV power.

When PV power is sufficient (Tp<PV max. power), if the storage energy needs to be charged, the storage energy charging is controlled so that the output power of the PV and the energy storage power station is Tp; otherwise the energy storage power station exits.

2. The mains is available but expensive from 08:00 to 12:00. If the PV is insufficient, it is recommended to use the energy storage power station during this time period. If the energy storage power station is insufficient, use the mains and power generation according to the priority. Charging for storage energy is allowed for the mains during 00:00~06:00 and the PV is allowed to charge all the time. It is allowed to send power back to the mains, and ensure the minimum load of the unit when using power generation.

 Application Mode:
 Mains available

 Fixed Power Mode

 Mains Module:
 Unavailable, the mains can provide unlimited power spinning

 reserve
 Vertice

 Setting Priority:
 08:00~12:00
 PV>Storage Energy>Mains Supply>Gen or

 PV>Storage Energy>Gen>Mains Supply
 Other time period
 PV>Mains Supply>Storage Energy>Gen

Setting charging time of mains supply running: 00:00~06:00

Time period: 08:00~12:00

When busbar is normal and PV is closed, the PV fixed power (Tp) (new energy fixed power percentage) output is controlled.

When PV power is insufficient (Tp>PV max. power), the energy storage power station starts (PQ), the fixed power output of PV and energy storage power station are controlled.

When PV power is sufficient (Tp<PV max. power), if the storage energy needs to be charged, the storage energy charging is controlled so that the output power of the PV and the energy storage power station is Tp; otherwise the energy storage power station exits.

If power generation takes precedence over mains supply, when PV power and energy storage power station are insufficient, the genset starts (PQ) to control the fixed power output of PV, energy storage power station and genset, at the same time, the minimum load of the unit should be ensured, otherwise, the genset will not start.

When power is sufficient, the power generation and energy storage power station will exit in turns. **Other Time Periods:**

When the mains supply is normal and PV is closed, the PV fixed power output is controlled.

When PV power is insufficient (Tp>PV max. power), the controller will issue an alarm.

When PV power is sufficient (Tp<PV max. power), if the storage energy needs to be charged, the storage energy charging is controlled so that the output power of the PV and the energy storage power station is Tp; otherwise the energy storage power station exits.

3. When the mains supply is unavailable and the PV power is insufficient, the energy storage power station is used, if the energy storage power station is insufficient, then use the power generation, if the PV power is sufficient, the storage energy is charged. The minimum load of the unit should be ensured when using power generation.

Setting Mode Island Mode

Setting Priority: PV>Storage Energy>Gen

Energy storage power station starts (VF) and PV is closed, PV power is controlled to ensure that there is no reverse power of the energy storage power station.

When the power of energy storage power station and spinning reserve are insufficient, the genset starts (VF) and the energy storage power station turns to PQ mode.

When the capacity of energy storage power station is insufficient, the genset starts (VF) and the energy storage power station stops to exit power supply sequence.

When the energy storage power station exits the power supply sequence, if PV power is sufficient and charging for energy storage power station until meet the capacity requirements of charging, then enters power supply sequence and the energy storage power station starts (PQ).

When the power of energy storage power station and spinning reserve are sufficient, the genset stops and the energy storage power station turns to VF mode.

4. When the mains supply is unavailable and the PV power is insufficient, then uses the power generation, if the power generation is insufficient, then uses the energy storage power station. The minimum load of the unit should be ensured when using power generation.

Setting Mode Island Mode

Setting Priority PV> Gen > Storage Energy

The genset starts (VF) and PV is closed to control the PV power, the minimum load of the unit should be ensured.

When the power of genset or spinning reserve are insufficient, the energy storage power station starts (PQ).

If load power is small, the energy storage power station is charged.

13 TYPICAL APPLICATION

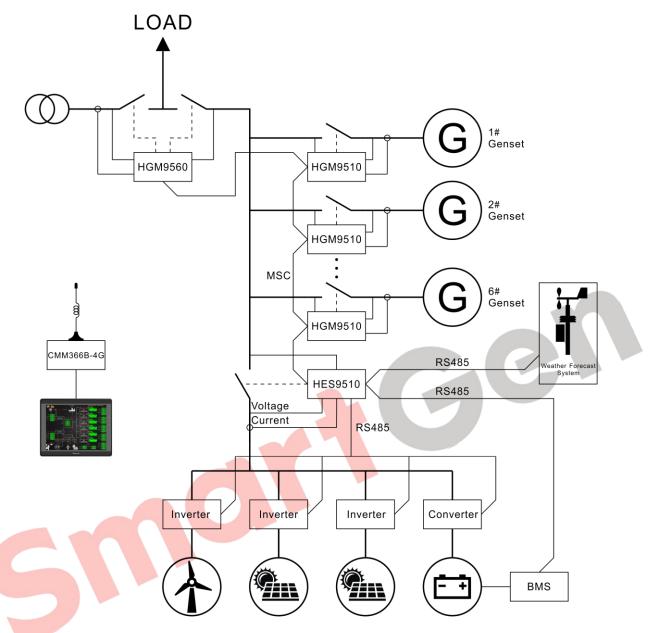

Fig. 7 HES9510, HGM9510 and HGM9560 Typical Application Diagram

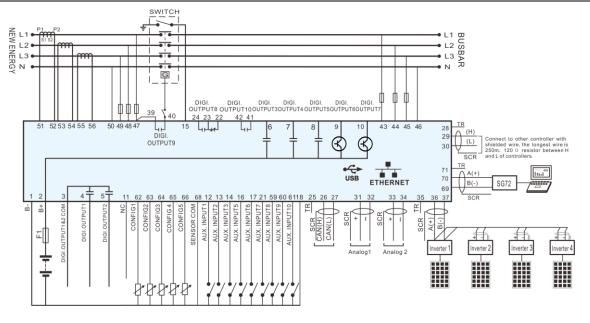

Fig.8 HES9510 Typical Application Diagram

ANOTE: Fuse F1: min. 2A; max. 20A; Fuse F2: max. 32A; Users should select the suitable fuse depending on practical application.

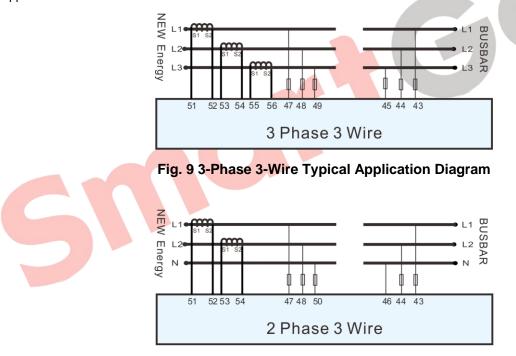

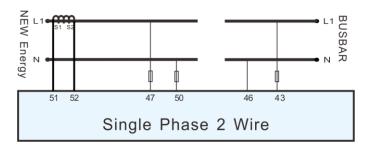

Fig. 10 2-Phase 3-Wire Typical Application Diagram

14 INSTALLATION

The controller is panel built-in design; it is fixed by clips when installed.

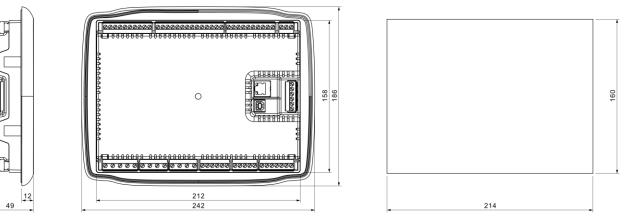

Fig. 12 Dimension and Cutout Size (Unit:mm)

1) Battery Voltage Input

ANOTE: HES9510 controller can suit for wide range of battery voltage (8~35) VDC. The wire area connecting controller power B+/B- with negative and positive electrodes must be over 2.5mm². If floating charge is configured, please firstly connect output wires of charger to battery's positive and negative directly, and then connect wires from battery's positive and negative to controller's positive and negative input ports separately in order to prevent the charge from disturbing the controller's normal working.

2) Output And Expand Relays

ACAUTION: If the expansion relay is needed, freewheel diode (relay coils is DC) and resistor and capacitor circuit (AC) shall be added to the two ends of the relay coils in order to prevent disturbing the controller or others equipments.

3) Alternate Current Input

Controller current input must be connected to outside current transformer. The secondary side current of the current transformer must be 5A and at the same time current transformer phase and input voltage phase must be correct, otherwise the collected current and active power are maybe not correct.

ANOTE: ICOM port must be connected to negative pole of battery.

WARNING! When there is load current, transformer's secondary side is prohibited open circuit.

4) Withstand Voltage Test

CAUTION! When controller had been installed in control panel, if need the high voltage test, please disconnect controller's all terminal connections, in order to prevent high voltage into controller and damage it.

15 FAULT FINDING

Symptoms	Possible Solutions
Power on but no response for the	Check starting batteries;
controller	Check controller connection wirings; Check DC fuse.
Start Failure	Check whether the "wait for start time" is enough;
	Check if the inverter has alarm;
	Check if alternate current is connected to inverter;
Switch Fault	Check close feedback wiring is correct or not;
	Check whether the switch closing/opening signals are continuous;
	Check whether switch acts or not;
Shutdown alarm in running	Check related switch and its connections according to the
	information on LCD;
	Check digital inputs.
RS485 communication is abnormal	Check connections;
	Check settings of COM port is correct or not;
	Check RS485's A and B connections is reversely connected or not;
	Check RS485 transfer model is damaged or not;
	Check communication port of PC is damaged or not.

Table 21 Fault Finding
